Chapter 1

Namespace Index

1.1 Packages

Here are the packages with brief descriptions (if available):

Build	7
Correctness_of_building	8
Data	9
Data_matching	10
Incremental_learning	12
Measure	13
Print_tree	15
Split	15
Test	16

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Build.Quantity	
Class with a dictionary in which the number of elements	17
Build.Subtree_Values	
Class with elemnet to save in all knots	18

Chapter 3

File Index

3.1 File List

Here is a list of all files with brief descriptions:

Build.py	21
Correctness_of_building.py	21
Data.py	22
Data_matching.py	22
Incremental_learning.py	22
Mesure.py	23
Print_tree.py	23
Split.py	23
Test.py	24

Chapter 4

Namespace Documentation

4.1 Build Namespace Reference

Classes

- class [Quantity](#)
class with a dictionary in which the number of elements
- class [Subtree_Values](#)
class with elemnet to save in all knots

Functions

- def [count_all](#) (training_data)
function to count all elements
- def [build_tree](#) (training_data)
function to build tree

4.1.1 Function Documentation

4.1.1.1 build_tree()

```
def Build.build_tree (  
    training_data )
```

function to build tree

Parameters

<i>training_elements</i>	list of training elements
--------------------------	---------------------------

Returns

object [Subtree_Values](#) for knot
 object [Quantity](#) for knot

4.1.1.2 count_all()

```
def Build.count_all (
    training_data )
```

function to count all elements

Parameters

<i>training_elements</i>	list in which items will be counted
--------------------------	-------------------------------------

Returns

quantity of elements all elements

4.2 Correctness_of_building Namespace Reference**Functions**

- def [correctness_of_building](#) (start, quantity)
function to build and print tree
- def [correctness_of_incremental](#) (start, quantity, tree)
function to incremental learning and print tree

4.2.1 Function Documentation**4.2.1.1 correctness_of_building()**

```
def Correctness_of_building.correctness_of_building (
    start,
    quantity )
```

function to build and print tree

Parameters

<i>start</i>	- the data number in the csv file used to train the tree
<i>start</i>	- quantity of data used to train the tree

4.2.1.2 correctness_of_incremental()

```
def Correctness_of_building.correctness_of_incremental (
    start,
    quantity,
    tree )
```

function to incremental learning and print tree

Parameters

<i>start</i>	- the data number in the csv file used to train the tree
<i>start</i>	- quantity of data used to train the tree
<i>tree</i>	- old tree

4.3 Data Namespace Reference

Functions

- def [read_data](#) ()
function to read and optimization data y
- def [read_data_without_scale](#) ()
function to read data y
- def [read_data_second](#) ()
function to read and optimization data education

4.3.1 Function Documentation

4.3.1.1 read_data()

```
def Data.read_data ( )
```

function to read and optimization data y

Returns

data

4.3.1.2 read_data_second()

```
def Data.read_data_second ( )
```

function to read and optimization data education

Returns

data

4.3.1.3 read_data_without_scale()

```
def Data.read_data_without_scale ( )
```

function to read data y

Returns

data

4.4 Data_matching Namespace Reference

Functions

- def [data_matching_for_basic_tree](#) (quantity)
function to do test for basic tree
- def [data_matching_for_basic_tree_data_without_scale](#) (quantity)
function to do test for basic tree for data without scale
- def [data_matching_for_tree_incremental_learning](#) (quantity_basic_tree, quantity)
function to do test for tree with one incremental learning
- def [data_matching_for_tree_incremental_learning_2](#) (quantity_basic_tree, quantity_1, quantity_2)
function to do test for tree with two incremental learning
- def [data_matching](#) (tree, data_test)
function for calculating test data matching
- def [find](#) (tree, dt, place)
find the list for test data

4.4.1 Function Documentation

4.4.1.1 data_matching()

```
def Data_matching.data_matching (
    tree,
    data_test )
```

function for calculating test data matching

Parameters

<i>tree</i>	
<i>data</i>	test

4.4.1.2 data_matching_for_basic_tree()

```
def Data_matching.data_matching_for_basic_tree (
    quantity )
```

function to do test for basic tree

Parameters

<i>quantity</i>	- quantity of data used to tarin dree
-----------------	---------------------------------------

4.4.1.3 data_matching_for_basic_tree_data_without_scale()

```
def Data_matching.data_matching_for_basic_tree_data_without_scale (
    quantity )
```

function to do test for basic tree for data without scale

Parameters

<i>quantity</i>	- quantity of data used to tarin tree
-----------------	---------------------------------------

4.4.1.4 data_matching_for_tree_incremental_learning()

```
def Data_matching.data_matching_for_tree_incremental_learning (
    quantity_basic_tree,
    quantity )
```

function to do test for tree with one incremental learning

Parameters

<i>quantity_basic_tree</i>	- quantity of data used to tarin basic tree
<i>quantity</i>	- quantity of data used to incremental learning

4.4.1.5 data_matching_for_tree_incremental_learning_2()

```
def Data_matching.data_matching_for_tree_incremental_learning_2 (
    quantity_basic_tree,
    quantity_1,
    quantity_2 )
```

function to do test for tree with two incremental learning

Parameters

<i>quantity_basic_tree</i>	- quantity of data used to tarin basic tree
<i>quantity_1</i>	- quantity of data used to incremental learning
<i>quantity_2</i>	- quantity of data used to second incremental learning

4.4.1.6 find()

```
def Data_matching.find (
    tree,
    dt,
    place )
```

find the list for test data

Parameters

<i>tree</i>	
<i>dt</i>	element for which we are looking for a place
<i>place</i>	leaf for element df

Returns

place leaf for element df

4.5 Incremental_learning Namespace Reference

Functions

- def [find_tree](#) (tree, data)
function to find the same tree in old tree
- def [incremental_learning](#) (data, tree)
function for incremental learning

4.5.1 Function Documentation

4.5.1.1 find_tree()

```
def Incremental_learning.find_tree (
    tree,
    data )
```

function to find the same tree in old tree

Parameters

<i>tree</i>	- old tree
<i>data</i>	current data

4.5.1.2 incremental_learning()

```
def Incremental_learning.incremental_learning (
    data,
    tree )
```

function for incremental learning

Parameters

<i>tree</i>	- old tree
<i>data</i>	current data

Returns

object Subtree_Values for knot
object Quantity for knot

4.6 Mesure Namespace Reference

Functions

- def [count](#) (training_elements)
function to count elements in all category (primary, secondary, ...)
- def [giny](#) (training_data)
function to calculate the gini coefficient
- def [gain](#) (false, true, current)
function to calculate the information gain

4.6.1 Function Documentation

4.6.1.1 count()

```
def Measure.count (
    training_elements )
```

function to count elements in all category (primary, secondary, ...)

Parameters

<i>training_elements</i>	list in which items will be counted
--------------------------	-------------------------------------

Returns

count_data dictionary with quantity of elements in all category

4.6.1.2 gain()

```
def Measure.gain (
    false,
    true,
    current )
```

function to calculate the information gain

Parameters

<i>false</i>	list of false elements in which the information gain will be counted
<i>true</i>	list of true elements in which the information gain will be counted
<i>current</i>	all list of true elements in which the information gain will be counted

Returns

info_gain information gain for current split

4.6.1.3 giny()

```
def Measure.giny (
    training_data )
```

function to calculate the gini coefficient

Parameters

<i>training_elements</i>	list in which items will be counted
--------------------------	-------------------------------------

Returns

1 - giny_tmp gini coefficient

4.7 Print_tree Namespace Reference

Functions

- def `print_tree` (element, space="")
function to print tree

4.7.1 Function Documentation

4.7.1.1 print_tree()

```
def Print_tree.print_tree (
    element,
    space = " " )
```

function to print tree

Parameters

<i>element</i>	tree
<i>space</i>	

4.8 Split Namespace Reference

Functions

- def `make_split` (training_data)
function to find the best split
- def `check_split` (training_data, question_split)
function to do split for only one question

4.8.1 Function Documentation

4.8.1.1 check_split()

```
def Split.check_split (
    training_data,
    question_split )
```

function to do split for only one question

Parameters

<i>training_elements</i>	list in which items will be split
--------------------------	-----------------------------------

Returns

best_gain_value the best find gain
 best_question_split the best find question to split
 best_true_data the best find list with true data
 best_false_data the best find list with false data

4.8.1.2 make_split()

```
def Split.make_split (
    training_data )
```

function to find the best split

Parameters

<i>training_elements</i>	list in which items will be split
--------------------------	-----------------------------------

Returns

best_gain_value the best find gain
 best_question_split the best find question to split
 best_true_data the best find list with true data
 best_false_data the best find list with false data

4.9 Test Namespace Reference**Functions**

- def [test](#) ()
test management function

4.9.1 Function Documentation**4.9.1.1 test()**

```
def Test.test ( )
```

test management function

Chapter 5

Class Documentation

5.1 Build.Quantity Class Reference

class with a dictionary in which the number of elements

Public Member Functions

- `def __init__ (self, data)`
save information about number of elements

Public Attributes

- `quantity`
number of elements

5.1.1 Detailed Description

class with a dictionary in which the number of elements

5.1.2 Constructor & Destructor Documentation

5.1.2.1 `__init__()`

```
def Build.Quantity.__init__ (  
    self,  
    data )
```

save information about number of elements

5.1.3 Member Data Documentation

5.1.3.1 quantity

`Build.Quantity.quantity`

number of elements

The documentation for this class was generated from the following file:

- [Build.py](#)

5.2 Build.Subtree_Values Class Reference

class with elemnet to save in all knots

Public Member Functions

- `def __init__` (self, [question](#), [right_next](#), [left_next](#), [gain](#), [true_data](#), [false_data](#))
save information about knots

Public Attributes

- [question](#)
question used to divide data
- [right_next](#)
next right knots
- [left_next](#)
next left knots
- [gain](#)
gain of information obtained
- [true_data](#)
list with true data - that met the query
- [false_data](#)
list with false data - which did not match the query

5.2.1 Detailed Description

class with elemnet to save in all knots

5.2.2 Constructor & Destructor Documentation

5.2.2.1 `__init__()`

```
def Build.Subtree_Values.__init__ (
    self,
    question,
    right_next,
    left_next,
    gain,
    true_data,
    false_data )
```

save information about knots

5.2.3 Member Data Documentation

5.2.3.1 `false_data`

`Build.Subtree_Values.false_data`

list with false data - which did not match the query

5.2.3.2 `gain`

`Build.Subtree_Values.gain`

gain of information obtained

5.2.3.3 `left_next`

`Build.Subtree_Values.left_next`

next left knots

5.2.3.4 `question`

`Build.Subtree_Values.question`

question used to divide data

5.2.3.5 right_next

`Build.Subtree_Values.right_next`

next right knots

5.2.3.6 true_data

`Build.Subtree_Values.true_data`

list with true data - that met the query

The documentation for this class was generated from the following file:

- [Build.py](#)

Chapter 6

File Documentation

6.1 Build.py File Reference

Classes

- class [Build.Subtree_Values](#)
class with elemnet to save in all knots
- class [Build.Quantity](#)
class with a dictionary in which the number of elements

Namespaces

- [Build](#)

Functions

- def [Build.count_all](#) (training_data)
function to count all elements
- def [Build.build_tree](#) (training_data)
function to build tree

6.2 Correctness_of_building.py File Reference

Namespaces

- [Correctness_of_building](#)

Functions

- def [Correctness_of_building.correctness_of_building](#) (start, quantity)
function to build and print tree
- def [Correctness_of_building.correctness_of_incremental](#) (start, quantity, tree)
function to incremental learning and print tree

6.3 Data.py File Reference

Namespaces

- [Data](#)

Functions

- def [Data.read_data](#) ()
function to read and optimization data y
- def [Data.read_data_without_scale](#) ()
function to read data y
- def [Data.read_data_second](#) ()
function to read and optimization data education

6.4 Data_matching.py File Reference

Namespaces

- [Data_matching](#)

Functions

- def [Data_matching.data_matching_for_basic_tree](#) (quantity)
function to do test for basic tree
- def [Data_matching.data_matching_for_basic_tree_data_without_scale](#) (quantity)
function to do test for basic tree for data without scale
- def [Data_matching.data_matching_for_tree_incremental_learning](#) (quantity_basic_tree, quantity)
function to do test for tree with one incremental learning
- def [Data_matching.data_matching_for_tree_incremental_learning_2](#) (quantity_basic_tree, quantity_↔
1, quantity_2)
function to do test for tree with two incremental learning
- def [Data_matching.data_matching](#) (tree, data_test)
function for calculating test data matching
- def [Data_matching.find](#) (tree, dt, place)
find the list for test data

6.5 Incremental_learning.py File Reference

Namespaces

- [Incremental_learning](#)

Functions

- def [Incremental_learning.find_tree](#) (tree, data)
function to find the same tree in old tree
- def [Incremental_learning.incremental_learning](#) (data, tree)
function for incremental learning

6.6 Measure.py File Reference

Namespaces

- [Measure](#)

Functions

- def [Measure.count](#) (training_elements)
function to count elements in all category (primary, secondary, ...)
- def [Measure.gini](#) (training_data)
function to calculate the gini coefficient
- def [Measure.gain](#) (false, true, current)
function to calculate the information gain

6.7 Print_tree.py File Reference

Namespaces

- [Print_tree](#)

Functions

- def [Print_tree.print_tree](#) (element, space="")
function to print tree

6.8 Split.py File Reference

Namespaces

- [Split](#)

Functions

- def [Split.make_split](#) (training_data)
function to find the best split
- def [Split.check_split](#) (training_data, question_split)
function to do split for only one question

6.9 Test.py File Reference

Namespaces

- [Test](#)

Functions

- `def Test.test ()`
test management function
